High Friction Surface Treatment (HFST) is a life-saving safety enhancement that bonds high friction aggregate to road surfaces. DBi Services’ HFST application technology consistently reduces stopping distances by up to 40% and significantly increases overall road traction on wet or dry surfaces. HFST offers proven crash reduction rates on sharp ramps, high risk horizontal curves, bridge decks and problematic intersection approaches.

This technology can be used to apply unique decorative demarcation areas that provide safer and easily recognizable bus lanes, pedestrian/walking lanes, school and hospital zones.
